Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

node	3
--------------------------------	-------------------

Chapter 2

File Index

2.1 File List

Here is a list of all documented files with brief descriptions:

red_black_tree.c	
Implementation of Red Black Tree	5

Chapter 3

Class Documentation

3.1 node Struct Reference

Collaboration diagram for node:

Public Types

- enum { **black**, **red** }

Public Attributes

- enum node:: { ... } **colour**
- int [info](#)
- struct [node](#) * [lchild](#)
- struct [node](#) * [rchild](#)
- struct [node](#) * [parent](#)

3.1.1 Member Data Documentation

3.1.1.1 int node::info

Stores whether the node is red or black

3.1.1.2 struct node* node::lchild

Stores the value of the node

3.1.1.3 struct node* node::parent

Pointer of the right node

3.1.1.4 struct node* node::rchild

Pointer of the left node

The documentation for this struct was generated from the following file:

- [red_black_tree.c](#)

Chapter 4

File Documentation

4.1 red_black_tree.c File Reference

Implementation of Red Black Tree.

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

Include dependency graph for red_black_tree.c:

Classes

- struct [node](#)

Functions

- int [find](#) (int item, struct [node](#) **loc)
Check whether a node with the given value exists in the tree or not.
- void [insert](#) (int item)
Inserts a new node. Incase of duplicate node, error is displayed.
- void [insert_balance](#) (struct [node](#) *nptr)
The function performs series of rotations needed after node insertion.
- void [del](#) (int item)
Delete a node from the tree.
- void [del_balance](#) (struct [node](#) *ptr)
The function performs series of rotations needed after node deletion.

- void `rotate_left` (struct `node` *ptr)
Rotates the tree about the given node in left direction.
- void `rotate_right` (struct `node` *ptr)
Rotates the tree about the given node in right direction.
- struct `node` * `succ` (struct `node` *ptr)
Finds the inorder successor of the given node.
- void `inorder` (struct `node` *ptr)
Displays Inorder traversal of the tree.
- void `display` (struct `node` *ptr, int level)
Level order traversal of the tree.
- int `main` ()
The Main Function of the Program.

Variables

- struct `node` * `root`
- struct `node` * `sentinel`

4.1.1 Detailed Description

Implementation of Red Black Tree.

Author

Shrukul Habib 13CO143
Anant Maheshwari 13CO111

4.1.2 Function Documentation

4.1.2.1 void del (int item)

Delete a node from the tree.

Parameters

<i>item</i>	Value of the node to be deleted
-------------	---------------------------------

Returns

Doesn't return anything, void.

4.1.2.2 void del_balance (struct node * ptr)

The function performs series of rotations needed after node deletion.

Parameters

<i>ptr</i>	value of the node to be deleted
------------	---------------------------------

Returns

Doesn't return anything, void.

4.1.2.3 void display (struct node * ptr, int level)

Level order traversal of the tree.

Parameters

<i>ptr</i>	The pointer of the root node
<i>level</i>	The Level of the the current node (1, if starting from root)

Returns

Doesn't return anything, void.

4.1.2.4 int find (int *item*, struct node ** *loc*)

Check whether a node with the given value exists in the tree or not.

Parameters

<i>item</i>	The value of the node to be checked
<i>loc</i>	The location of the found node

Returns

Doesn't return anything, void.

4.1.2.5 void inorder (struct node * *ptr*)

Displays Inorder traversal of the tree.

Parameters

<i>ptr</i>	The pointer of the root node.
------------	-------------------------------

Returns

Doesn't return anything, void.

4.1.2.6 void insert (int *item*)

Inserts a new node. Incase of duplicate node, error is displayed.

Parameters

<i>item</i>	The value of the node to be inserted.
-------------	---------------------------------------

Returns

Doesn't return anything, void.

4.1.2.7 void insert_balance (struct node * *nptr*)

The function performs series of rotations needed after node insertion.

Parameters

<i>nptr</i>	The pointer of the new node.
-------------	------------------------------

Returns

Doesn't return anything, void.

4.1.2.8 int main ()

The Main Function of the Program.

for parent of root node and NULL nodes

Returns

Doesn't return anything, void.

4.1.2.9 void rotate_left (struct node * ptr)

Rotates the tree about the given node in left direction.

Parameters

<i>ptr</i>	The pointer of the node about which the tree is to be rotated.
------------	--

Returns

Doesn't return anything, void.

4.1.2.10 void rotate_right (struct node * ptr)

Rotates the tree about the given node in right direction.

Parameters

<i>ptr</i>	The pointer of the node about which the tree is to be rotated.
------------	--

Returns

Doesn't return anything, void.

4.1.2.11 struct node * succ (struct node * ptr)

Finds the inorder successor of the given node.

Parameters

<i>ptr</i>	The pointer of the given node.
------------	--------------------------------

Returns

The pointer of the successor node.

4.1.3 Variable Documentation**4.1.3.1 struct node* sentinel**

This is the pointer of the root node
